FOR IMMEDIATE RELEASE

SPATIALinfo Announces Network Management Software for Field Technicians

SpatialOFFLINE™ offers cable technicians ability to view and edit networks in the field

Englewood, Colo., October 19, 2009—SPATIALinfo, a leading provider of network management software, introduces an addition to its spatialSUITE line of products, spatialOFFLINE. Designed specifically for cable field technicians, spatialOFFLINE displays network maps, with the ability to make changes offline that can later be uploaded to a main database.

“This addition to spatialSUITE offers a superior product for those needing to access the network database offline on a regular basis,” said SPATIALinfo Chief Executive Officer Greg Foster.

With spatialOFFLINE, field technicians can now view network maps on laptops or tough books, right in the field. When connected to a network, data is automatically synchronized and updated with the newest information in the main database. When offline, users can still record redlines, perform network fault analysis and trace networks.

SpatialOFFLINE allows users to download entire regions of mapping and network data from the central database, including network topology and fiber information. All management is handled through a centralized sync server that can manage thousands of remote clients.

“SpatialOFFLINE provides a huge benefit to the cable industry,” said SPATIALinfo Director of Product Development Jason Doherty. “Field technicians, locators and fiber splicers now have access to all network intelligence that fiber and RF designers have at the central office. SpatialOFFLINE will work anywhere, with or without a network connection. It synchronizes data and trace information so that users always have the latest information at their fingertips.”
